

Reflection for Plant Pathology Module

This week in Foundations in Horticulture, we discovered plant diseases involve the interaction between a plant and a disease-causing microorganism under the appropriate environmental conditions. Proper disease management often involves using multiple strategies.

Disease diagnosis is not an easy process and only a handful of diseases are recognizable by eye. Most disease diagnoses will require the assistance of a plant disease expert.

Now that you are familiar with the signs and symptoms related to plant diseases, what are you going to do the next time you see them on your plants?
